

► functions.

↳ a block of code / sub-program.

↳ that is linked to a well-designed task.

Why

↳ Resuable

↳ Readable.

Issues (That's why we use this)

↳ lengthy / Bulky

↳ Buggy

↳ Readability.

↳ Resue - X

```

    int main()
    {
    }
  
```

↳ function name (entry point)
 ↳ input parameters.
 ↳ return type.

```

    return 0;
  }
  
```

↳ says that program has been successfully executed.

→ Simple function.

"Sundar ko sundari pasand hai"
Print 10 times

```
void printLine ( )
{
    for (int i=0; i<10; i++)
    {
        cout<<"Sundar ko sundar  
pasand hai" ;
    }
}
```

```
int main() {
    printLine();
    return 0;
}
```

function declaration.

void printMessage();

int addNumbers (int a, int b);

function definition.

```
int addno (int a, int b) {
    return a+b;
}
```

→ Simple function

"Sundar ko sundari pasand hai"

Print 10 times

```
void printLine ( )
```

```
{  
    for (int i=0; i<10; i++)  
    {
```

```
        cout << "Sundar ko Sundar"  
            "pasand hai" ;
```

```
    }  
}
```

```
int main() {
```

```
    printLine();
```

```
    return 0;
```

```
}
```

function declaration

```
void printMessage();
```

```
int addNumbers (int a, int b);
```

function definition

```
int addno (int a, int b) {  
    return a+b;  
}
```

function call

functionName (); If you have arguments
the put it here.

print-no (a, b);

existence of function in c++

function
definition.

Line 110 - function call

You have to make sure
that the definition of
function is always above

and if you want of calling function.
to run the function even from
below then you have to declare the
function at the top.

Snippet

```
void printLine() {  
cout << "Hey! How are you" << endl;  
}
```

```
void printLine(); // declaration
```

```
main() {
```

```
    printLine(); // call
```

```
    return 0; }
```

```
void printLine() { // definition
```

```
    cout << "Hey There! How are you";
```

```
}
```

functions have multiple return types which return value as of their data type but as we know void is a null data type so, void does not return anything.

Snippets

```
void printA() {
    cout << "I am inside A" << endl;
}
```

```
int main() {
    cout << "Hi" << endl;
    printA();
    return 0;
}
```

→ Function Call Stack

- ↳ Info about function/calls. Stack? (Yes)
- ↳ Local variables
- ↳ multiple function - stack of plates calling.

↳ Returning function of multiple data types.

→ Last in
First out.

① Snippet

```
int main() {
```

```
    cout << "inside main";
```

```
    printA();
```

```
    cout << "Back in main";
```

```
    return 0;
```

```
}
```

```
void printA() {
```

```
    cout << "inside A";
```

```
    cout << "going back  
to main";
```

```
}
```

function
call stack.

function
Body
ends

printA
main

function addition
entry

removes from
function call stack
after implementing
of functions.

②

```
int main() {
```

```
    printA();
```

```
}
```

```
printA() {
```

```
    cout << "inside A";
```

```
    printB();
```

```
}
```

```
printB() {
```

```
    cout << "inside B";
```

```
    printC();
```

```
}
```

function
implementa-
tion
ends.

printC
printB
printA
main

function
implementation
starts

```
printC() {  
    cout << "inside c";  
}
```

Q. Sum of Three nos using function.

```
#include <iostream>
using namespace std;
// using void data type.
void sumofThree(int a, int b, int c)
{
    cout << "The sum is : " << a + b + c;
}
```

```
// using Integer data type.
int sumofThree (int a, int b, int c)
{
```

```
    return a + b + c;
}
```

```
// using return in void data type func
```

```
void message(int c) {
    cout << "message one";
    return;
```

```
    cout << "message two";
}
```

```
int main() {
```

```
    int x, y, z;
```

```
    cin >> x >> y >> z;
```

```
    // For void func
```

```
    sumofThree (x, y, z);
```

```
    // For int func
```

```
    int res = sumofThree (x, y, z);
```

```
    cout << "The sum is : " << res;
```

```
    // return in void
```

```
    message(int c);
```

```
}
```
